SUBJECT: Automated Site Efficiency Tracker - Week 1 Report

CONTEXT: What Was Built and Why

Every operational site has a monthly production target. Currently, checking whether sites are meeting those targets requires manual spreadsheet work, a slow process where problems often surface too late to fix. To solve this, I built a simple automated scorecard, a digital tool that reads each site's actual output against its target and instantly calculates a performance score. It then labels each site as either performing well, needing attention, or in a critical state requiring immediate action. No manual calculations. No delays.

INSIGHT: What the Data Is Telling Us

-  **Kisumu Depot** is in crisis — operating at only **51%** of its monthly target. Under a manual system, this would surface at the end of the month. This tool flags it today.
-  **Nairobi Depot** sits at **87.5%** — a warning zone with a 12.5% gap still to close before month-end.
-  **Mombasa Depot** is exceeding its target at **102%** — a strong performer whose practices should be studied.

The critical difference between this tool and a manual check is speed.

ACTION: Recommended Next Steps

- **Kisumu Depot** — assign a team immediately to investigate the cause of low output this week, not at month-end
- **Nairobi Depot** — conduct a performance review this week to close the remaining gap before the month closes
- **Mombasa Depot** — document what they are doing right and share it as a best practice model for other sites
- **Going forward**, run the scorecard **weekly**, not monthly, so every site gets an early warning signal while there is still time to act
